The present sequence encodes an andothelial cell protein Cyactivated protein C receptor (EPPP). a type I transmembrane qlycoprofein. The protein binds with high affinity to both protein C (which plays a major role in blood coagulation) and activated protein C (Yd-30 nH) and is calcium dependent. It is a member of the CDL/MHC superfamily and has a role in regulating the inflammatory response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA encoding endothelial cell protein receptor.

                                                                                                                                                                                                                                                                                                                                                                                       CC receptor, used in the method of the human endothelial cell protein CC receptor, used in the method of the invention where endothelial protein CC teceptors (FCD) is used in diagnosis of inflammatory and compilation CS states and lisorders essociated with damage to endothelium and large Diagnosis to inflammator. The protein is one of the requilation of a host to be activated in the compulation system, and is thought to control C compilation and inflammation. Activates protein C. The protein C pathway (in protein) activates protein C. The protein C pathway (in apparently only involved in large blood vessels, not capillaries, and so is a-ivated with for major vascular conditions, and the C increased riversence of the receptor in the conditions stated makes it composed riversence of the receptor in the conditions stated makes it composed riversence of the receptor in the conditions stated makes it composed riversence of the receptor in the conditions stated makes it composed riversence of the receptor in the conditions stated makes it composed riversence of the receptor in the conditions stated makes it composed riversence of the receptor in the conditions stated makes it composed riversence of the receptor in the conditions.

CC vascular discase (especially cordiopulmonary bypass, unstable annima, respector in the conditions and the composed riversence of the receptor in the conditions.

Chamban endothelial protein C receptor (EPG). The invention relates to a modified form of EPGR, in which the C-terminal Cys of the membrane-to a condition form is not paintoylated, or is otherwise replaced by a different camino acid; to a soluble splice wariant of EPGR, which lacks a transmembrane domain; and to a EPGP in which the transmembrane domain of the membrane-bound form has been removed by proteolytic cleavage. Splicing of exon III to exon IV (which encodes the transmembrane domain) the EPGR RNA transcript results in an mRNA encoding the soluble form cludes intron III sequences. The intron III sequence includes an inframe termination codon: translation of intron III containing mRNA cresults in an EPCR protein with a variant sequence (ANSH177) immediately CC C-terminal of glycine 201. EPCR binds both protein C and its activated code form, activated protein C (APC), with similar affinity in the presence of calcium. The membrane-bound form facilitates protein C activation by competing with membrane-bound EPCR for protein C complex on cell surfaces. In contrast, the soluble form inhibits protein C calcium. The membrane-bound Grow facilitates protein C activation of protein C to a thrombin/thrombomodulin activation complex on calcium. The competing with membrane-bound EPCR for protein C. The calcium in of blood coagulation. Pattents deficient in protein C calcium. The competing with membrane-bound EPCR for protein C. The calcium in of blood coagulation. Pattents deficient in protein C. In the recein C. usually exhibit life-threatening thrombotic complications in infancy.
               Claim 4; Columns 21-22; 24pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified endothelial protein C receptor, useful as diagnostic marker of e.g. Inflammation or autoimmune diseases, is a soluble or alternatively spliced form of the receptor.

Measurement of soluble EPCR levels is used to diagnose disorders involving coagulation or inflammation, autoimmune diseases (e.g., lupus erythematosus), and conditions such as sepsis, diabetes, pre-eclampsia and restences's. EPCR quantitation may be used for monitoring treatment, and may also be used to indicate damage to large blood vessels, as such damage stimulates proteolysis of endothelial cell membrane-bound EPCR, or the expression of the soluble EPCR splice variant. Anti-EPCR antibodies may also be used to characterise and isolate EPCR proteins and to modulate EPCR activity, particularly to inhibit ligand binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 15-JUL-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AN AANIIs to AANII 721 represent to DNAs corresponding to 71 human scripted CC protein games, and AANISON person the barnes protein transcuts.

CC The secreted proteins and their genes are useful for proteins they encode. The secreted proteins and their genes are useful for proteins or gene therapy to a maniforation redical conditions, e.g., by protein or gene therapy to a maniforation redical conditions can be diagnosed by determining the amount of the CC the new genes, specific uses are described for each of the 71 games. In the seed on the tissues in which they are most highly expressed and include CC developing products for the diagnosis or treatment a brother title. CC the new genes, specific uses are described for each of the 71 games. In CC developing products for the diagnosis or treatment a brother it is considered. CC developing products for the diagnosis or treatment a brother titles. CC developing products of the 1mmune system, AIDS, autolomous discorders, cancer turours, forein and developmental abnormal titles. CC discases (e.g., rebumated) at this is an indevelopment of the 1mmune system, AIDS, autolomous discorders, cancer turours, forein and development of the 1mmune system, AIDS, autolomous discorders, cancer turours, forein and architecture, although stin discorders (e.g., AIDS, autolomous discorders, cancer (e.g., AIDS, autolomous discorders), reportants, septis, althoryers, gastrointestinal discorders. CC analogonit discorders kidney discorders, sastrointestinal discorders, and indevelopment of the analogonit discorders and considers, cardiovascular discorders. The proteins can also be used to all wound healthman of printering tissues, to regular discorders and include the proteins are also be used to all wound healthman of printering tissues. The proteins can also be used to all wound healthman, to maintain organic printers, and in chemotaxits, and can be used as a food additive or printering of the invention of the invention can be used as a food additive or printers, and in chemotaxits, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Overy Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      09-AUG-2001 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to zsig@l and fragments thereof. The invention is useful for promoting would healing, for modulating the proliferation, differentiation, migration or metabolism of responsive cell types that includes both primary and cultured cell lines, and for stimulating the proliferation of cells expressing markers associated with dendritic lineage cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (ZYMO ) ZYMOGENETICS INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ax AADD8101-AADD8472 represent cDNAs corresponding to 24 human secreted protein genes, and AAD84100-AAD80470 represent the proteins they encode. AAD84172-AAD80497 represent human secreted proteins they encode. The secreted proteins and their genes are useful for preventing, treating cor ameliorating medical conditions, e.g., by protein of preventing, treating cor ameliorating medical conditions, e.g., by protein of the amount of the new genes. Specific uses are described for peach of the 24 genes, come the risks in which they are most highly expressed, and include developing products for the diagnosis of treatment of proliferative disorders, cancer, tumours, foetal and, developmental abnormalities, chematodo arthritis), inflammation, allergies and include diseases (e.g., themmatod arthritis), inflammation, allergies, compilive disorders scheep, Altheimer's disease, Parkinson's disease), compilive disorders, whichey disorders, gastrointestinal disorders, comprises (e.g., themmatod arthritis), inflammation, allergies, compilive disorders, whichey disorders, gastrointestinal disorders, proping and the prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting deep combine, to an also be used to ald wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cent liquads or binding or partners, and in chemotaxis, and can be used as a food additive or partners, and in chemotaxis, and can be used in allevating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., and the invention can be used an allevating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., and the invention and included specific for a protein second second as a buman secreted protein-encoding conditive or the invention.
                                                                                                                                                                                                                                                                                                                                Query Match 3.5%;

This is the sequence of the OTYZA SATIVA (Fice) gene, pPFK-OSI, as given in the specification. Plants transformed with these genes can express the enzyme. The transformed plants can produce varieties that have altered sugar moniton on storage at low temperatures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 8; Page 46-49; 79pp; Japanese.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA coding for fructose-6-phosphate 1-phosphotransferase - of plant origin, for prodm. of transformant plant cells with altered sugar content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          23-FEB-1995
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oryza sativa.

Communosuppressant and cytostatic activity. The polynucleotides are useful configuration of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous containing a polypeptide or polynucleotide contains, such as peripheral nervous injuries, peripheral nervous system diseases, such as contained and threat and contained and the sease, amyotrophic contained and state of the sectivity and shy proager Syndrome, other uses include the cutilisation of the activity, cancer diagnosis and threaty, haemostatic cand thrembolytic activity, cancer diagnosis and threaty, due screening, consensy for receptor activity, arthritis and inflammation, leukaemias and contains, and shy procession contains and contain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of the nomeybee alpha-glucosidase. The gene can be used for the preparation of Apis mellifer a alpha-glucosidase I. The present sequence is the coding sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention devitbes movel human nucleic acid sequences from tumor breast tissue which have cytostatic activity. The nucleic acid sequences can be used to produce and isolate full-length gene sequences. They can be used to express proteins, which can be used as tools to find an activity against heast cancer. The sequences can be used in sense or antisense form. They are especially useful for medicaments for gene therapy to truck hreast cancer. Ac233(1):246(7) represents expressed sequence tags described in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is the coding sequence for portine CD29 protein. CD29 contains rpitopes Gal-alpha-(1.3)-Gal, which are recognised by genoreactive human antibodies, leading to hyperacute rejection of xenograffs. The present invention relates to CD29 proteins, which have an identical, reduced or zero expression of epitope Gal-alpha-(1.3)-Gal, which can be used to reduce or prevent hyperacute rejection associated with xenotronsplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Porcine; CD29; immunosuppressive; immunomodulatory; epitope Gal-alpha-(1.3)-Gal; xenotransplantation; xenograft; ss.

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (AMA). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, remail cancer, colon cancer, gastric cancer, prostate cancer and und cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cancer associated antigen; diagnosis: research: treatment: human:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence encoding the P195 protein of Plasmodium falciparum (AAM5030) and a peptide comprising at least one of its epitopes (see AAP5077) are claimed. Also claimed is a vaccine for inducing immunity to malaria comprising the novel peptide or P195 or a peptide comprising at least one epitope when derived from the new DNA sequence, together with a carrier.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes Pneumocystis carinii (P. carinii)

Caninoacyl-RNA synthetase enzymes. The nucleic acids encoding aninoacyl-
CRNA synthetase enzymes. The nucleic acids encoding aninoacyl-
CRNA transpares may be used to produce expression vectors and

Chost cells for the recombinant production of pneumocystis aminoacyl-
CRNA

Synthetase. The proteins may then be used in other procedures such as

CRNA

C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match 3.4%; So

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes Pneumocystis carinii (P. carinii)
annoacyi-ERNA synthetase enzymes. The nucleic acids encoding aminoacyi-
ERNA synthetase enzymes may be used to produce expression vectors and
thost cells for the recombinant production of Pneumocystis aminoacyi-ERNA
Synthetases. The proteins may then be used in other procedures such as
c separating amino acids from samples or as antigens in the production of
antibodies. The nucleic acids may also be used to produce tester cell
c strains (which contain the nucleic acids) which may be used to test
c candidate drugs (e.g. tRNA synthetase inhibitors) for the treatment of
c disorder associated with P. carinii such as pneumonia which is a common
c complication for acquired imanue beficiency Syndrome (AIDS) patients and
c other immuno-compromised individuals. Additionally, they may also be
used to detect and isolate related DNAs in sample (i.e. they can be used
c as probes). The present segmence represents a PCR primer for a
c present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ouery Match 3.4%: Sometime State Sest Local Similarity 100.0%; I Matches 20; Conservative 0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the present oligonucleotide is the human mitochondrial DNA heavy chain primer AMH6070, where the No. is the position adjacent to the position adjacent to the position adjacent to the position of at least 2 used in a claimed method for the identification of at least 2 considered in a polynucleotide chain.

A sample is mixed with primers (P) that are complementary to the characterised base sequence so that they annual to the nb, at classically types of chain terminator each having a characteristic fluorescent label, and a chain extending enzyme so that the extended P are then sept. according to size or charge, and the extended P are then sept. according to size or charge, and the screen for genetic diseases associated with single nb, and for DNA typing, e.g. in forensic testing, it may also be used to screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb, and for DNA concerns the service of the screen for genetic diseases associated with single nb.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match 3.4%;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to methods of covalently tagging proteins with their encoding DNA sequences. Several methods may be used to create these DNA-protein fusions. In owneral, the methods involve linking a corpiner to an RNA molecule, then translating the RNA to produce a protein which is bound to the primer. The RNA is then reverse transcribed to complete the translating the RNA to produce a protein corpine as used to demonstrate DNA-protein fusion. The present sequence is model mRNA is contained to that was used to demonstrate DNA-protein fusion formation. This cosequence was used as a substrate for the binding of linker 7 (see CC AAA61351). The DNA-protein fusions are useful in binding and molecular corporation assays that involve biological materials containing continuous seases. The covalent bond between the protein and the encoding CDNA makes the fusion more stable than RNA-protein fusions. This means conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match 3.4%;

Nor carbohydrate source), as a vytokine for cell proliferation and differentiation activity, as immune stimulants or suppressors, e.g. for viral, bacterial or fungal infections, for autohumune diseases such as multiple sclerosis or systemic lupus arythematosus, to regulate hemmatopolesis, for tissue growth, as an activin or inhibin, or having chemotactic or chemo-kinetic, harmostatic and thrombooytic, receptor/ligand, anti-inflammatory or turbur inhibitory
The present invention relates to methods of covalently tasking proteins with their encoding DNA sequences. Several methods may be used to create these DNA protein fusions. In general, the methods involve linking a primer to an RNA molecule, then translating the RNA too produce a protein which is bound to the primer. The PNA is then reverse transcribed to give a DNA-protein fusion. The present sequence is model PNA substrate in that was used to demonstrate DNA protein fusion formation. The DNA-protein fusions are useful in binding and molecular recognition assays that involve biological materials containing ribonucleases. The covalent bond between the protein and the encoding PNA makes the fusion more stable than PNA-protein fusions. This means selection experiments need not be limited to extremely mild reaction conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure: Page 94: 117pp: English

                                                                                                                                                                Sequences AAA31040-A32093 represent nov-1 plant microsatellite sequences and associated flanking species. The sequences comprise a central core repeat sequence, especially selected firm the sequences AAA32094 A32096 with left and right flanking sequences. The polynuciections sequences can be used in the detection of DNA polynophisms, in genome mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for colligonucleotide ingerprinting and livary screening and to design primers for microsatellite primer for microsatellite primer for microsatellite primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 115 BP; 48 A; 23 C; 23 G; 21 U; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes lung tumour specific polynucleotides and tumour antigens. AAC07144 to AAC07245 and AAC08257 represent specifically claimed polynucleotides, and AAV23485 to AAV23571 represent amino acid sequences from the present invention. The lung tumour specific polynucleotides and polypeptides can be used in pharmaceutical compositions and vaccines to inhibit the development of lung cancer. They can also be used to detect lung cancer in a patient. Probes and antibodies derived from the lung tumour sequences are useful in detection of lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 13; Page 139; 171pp; English. ## ALIGNMENTS

DNA encoding human breast tumour protein immunogenic fragment.

Breast tumour protein; immunogenic fragment; vaccine; detection; breast cancer development; therapy; ss.

New preast tumour protein genes used, in vaccines for immunotherapy, or for diagnosis of breast cancer

The polypeptides or nucleic acids encoding them are useful in vaccines and pharmaceutical compositions for manufacture of medicaments for inhibiting the development of breast cancer in a patient. They can also be used to treat breast cancer, Antibodies against these polypeptides can be used to detect and monitor progression of breast cancer in patients. Frimers and probes derived from the polymocleotides encoding the breast proceins are useful for detection of breast cancer. Peripheral blood cells from a patient incubated in the presence of at least one polypeptide, such that I cells proliferate, are useful in manufacture of a medicament for treating breast cancer in a patient. Antigen presenting cells incubated in the presence of at least one polypeptide are also useful for treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1079 BP; 327 A; 229 C; 177 G; 346 T; 0 other;

A novel isolated polypeptide comprising an immunogenic portion of a treast cancer protein useful in the detection and treatment of breast caucer:

Claim 4; Page 77; 55pp; English.

The present sequence was isolated from a breast tumour cDNA library. It is provided in a specification relating to compounds for immunotherapy and diagnosts of breast cancer. Breast tumour antigens and the polynucleotities that encode them may be used in the production of a paramaceutical composition to be used in the treatment of breast cancer. Proliferated Teells and incubated antigen presenting cells are also required the polypeptides and polynucleotides may also be used to produce a vaccine.

Claim 1; SEQ ID NO 1200; 10078pp; English.

for treating disorders

The invention relates to human nucleic acids (AM15795-AM161369) and the encoded polypeptides (AM36612-AM46131) with montropic, and incoming the polypeptides are useful in gase therapy. A composition containing a polypeptide or polynucleotide in gase therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system diseases, such as peripheral nervous injuries, peripheral nervopathy and incoming a polypeptide or polynucleotide of the invention may be used to treat diseases, such as extended the control solvenops. Activity, and incoming the activity and states, the state of the servous system suppression, and intrombolytic activity, cancer diagnosis and inflammation, leukeemias and each state of the activity and servous and inflammation, leukeemias and servous and activity and activity and theraptic activity. Kate: The sequence data for this patent did not form part of the printed specification.

                                                                                                                         the invention relates to human nucleur acids (AAIS7798 AAI61169) and the encoded polypeptides (AAIS46211) with mootropic.

Inmunosuppressant and cytostatic activity. The polynuclectides are useful in gene therepy. A composition containing a polypeptide or polynuclectide containing a polynuclectide containing and period and containing and containing and containing and containing a polynuclectide containing and containing a polynuclectide containing a polynuclectide

(VLAA+) VLAAMS INIERUNIVERSITAIR INSE BIOTECHNOG Haylebroeck Dif:

Novel proteins used to treat inflammatory diseases, NF-kappaB related diseases and for improvement of anti-tumor treatments .

Claim 9; Fage 37-35; 46pp; English.

This sequence represents the gene encoding human CAO receptor associated protein (CRAP). CRAP is a functional protein capable of the tracting with the cytoplasmic domain of CAO and/or other receptors of the tumour necrosis factor (IRA) receptor superfamily such as CDO cand IRA receptor i, where the protein has no homology to TMA receptor associated factor (IRAP) proteins. The CO40 binding proteins can be used as modulators of the CD40 signalling pathway, especially to dispress and treat IRAF related, CD40 related, NF-Appab related and/or compared to the compared to fail tumour discusses. Diseases which may be treated include atherosclerosis, context is called the sclerosis, systemic lupus crythematosus, graft rejection, graft versus host disease, all for the improvement of anti-tumour treatments can be used to sensitive tumour cells to anti-tumour treatments and to screen for compounds which interfere with the proteins can be used to sensitive tumour cells to anti-tumour treatments and to screen for compounds which interfere with the proteins can be proteins with other protein components of the TRAF, CD40 or NF-Kappab related pathway.

ker Topoisomerase II: binding protein : useful as an anticancer agent

Disclosure; Fage 16-15; 28pp; Japanese.

This sequence encodes the topoiscomerase II Linding protein (TopBP) of the invention. The Topp protein is useful as an anticancer agent. TopBP can be used as the target molecule for anticancer agent.

Sequence 2499 BP; 720 A; 505 C; 567 G; 687 T; 0 other;

AAC97991 to AAC98763 encode the human ocion carcor associated proteins, called human colon cancer antigens, given in AA69244 to AA694086. The Chiman colon cancer antigens can have cytostatic, cardioactive, muscular; netroprotective, influencedularcory, gysaecological, gastrointestinal, cultivatery, nephrotropic, antiniective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynocleotides, and can be used in gene therapy. The colon cancer antigen polynocleotides, and creation and aliagnosis of colon disorders such as colon cancer. The proteins are useful for the prevention, cultratact, and diagnosis of colon disorders, such as colon cancer. The Colynocleotides may be used in dispositios and research, such as for color, cancer if ication, and as hybridisation probes. The proteins color cancer is entitled to prevent diseases such as incural disorders, immune color diseases such as incural disorders, such cardiors, lineartious diseases, and cardiovascular visorders, according to AA69872 and AA59407 represent sequences used in the exemplification of the present content of the present color and cancer is a color cancer. Claim 1; Fage 597; 2164pp; English.

Claim 8: Say ib 13205: 2537pp - CD ROM; anglish

An ine present invention describes primer sets for synthesising 5602 Cd [ill]-length chiks defined in the specification. Where a primer set comprises: (a) an object of primer and an object of complementary complementary strand of a polyvuclectide which complementary the 5602 handscalde sequences defined in the specification, where the collipcincolocials comprises at least 15 nucleotides or (t) a combination of an objective includes of the complementary to the complementary included the comprises at least 15 nucleotides or (t) a combination of a polyvucleotide which comprises a 5 fend of a polyvucleotide comprises a 5 fend of the combination of comprises a 5 fend of a polyvucleotide. The primer sets can be used in antisense therapy and comprises a 5 fend of the comprises therapy and comprise comprises a 5 fend of the comprise comprise comprise comprises a 5 fend of the comprise comprise comprises a 5 fend of the comprise comprise comprise comprises a 5 fend of the comprise comprise comprises a 5 fend of the comprise comprise comprises a 5 fend of the comprise comprises a 5 fend of the comprise comprises a 5 fend of the comprise comprise comprises a 5 fend of the comprise comprises a 5 fe

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            В
                                                  The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the 5602 nucleotide sequences defined in the specification, where the CC cliponucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end CC complementary to an oligonucleotide comprising a sequence complementary to a combination of CC complementary strand of a polynucleotide which comprises a 3'-end sequence complementary to a coligonucleotide which comprises a 3'-end sequence, where the coligonucleotide which comprises as 15 nucleotides and the combination of CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primers set useful for synthesising polynucleotides, and gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the CC particularly without any specialised methods. AAH03166 to AAH13628 and CC AAH3633 to AAH31872 represent human cDNA sequences; and AAH11629 to AAH13632 cof the present human amino acid sequences; and AAH13629 to AAH13632 cof the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primer sets for synthesizing polynucleotides, particularly the 5502 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; SEQ ID 4908;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         02-MAY-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Dβ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                         The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring luman gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.
                                                               of diseases of the cervix, notably cervical cancer.
Note: The sequence data for this patent did not form specification, but was obtained in electronic format at ftp.wipo.int/puh/puhlishad nor communication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1043
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 440

                                                                                                                                                                                                                                                                                                      The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one sprobe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1024
                                                                                                                                      Sequence 691 BP;
                                                                                                                                                                                                        expression, the probes are therefore useful in grading and/or of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of useful increases, but was obtained in electronic formal directly specification, but was obtained in electronic formal directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ď
                                                                                           products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytckline activity, cell proliferation and differentiation activity, hasmatopoissis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotractic/chemokinetic activity, hasmostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptides can be used firecting extracellular secretion of a polypeptide or the insertion of a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAX40438 to AAX40715 represent 5' expressed sequence rags (ESTs) for human secreted proteins expressed in prostate, and encode the proteins given in AAX11716 to AAX11593 respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human: secreted protein; EST; expressed sequence tag; diagnosis; forensic; gene therapy; chromosome mapping: slynal peptide; prostate; upstream regulatory sequence; cytokine activity; cell proliferation; differentiation; haematopoiesis regulation; tissue growth regulation; reproductive hormone regulation; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New issiated prostate-derived nucleic acids - used to develop products which may have cytokine, immune regulatory, maematopolesis regulating, anti-inflammatory or tumour inhibition activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1; Page 298; 675pp; English.

                                                                                                                                                                                               AA265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AA269579 to AA277440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human genome; biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; diagnosis; single nucleotide polymorphism; SNP; ds.

CC The present invention describes primer sets for synthesising 5602 CC comprises: (a) an oligo-dr primer and an oligocuclectide complementary to the complementary strand of a polynucleotide which complementary CC the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises as sequence complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprising a sequence, where the CC sequence and an oligonucleotide comprises a 3'-end sequence, where the CC oligonucleotide which comprises at least 15 nucleotides and the combination of CC the 5'-end sequence 3'-end sequence is selected from those defined in the specification. The primers sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, particularly full length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CDNAs. The primers allow cottaining of the full-length CDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAH3633 to AAH18742 represent human cDNA sequences; AAA92446 to CC AAB95893 represent human amino acid sequences; and AAH13629 to AAH13620 crepresent oligonucleotides, all of which are used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunosuppressive; antiinflammatory; immunosuppressive; antiinflammatory; immunosuppressive; antiinflammatory; immunosuppressive; antiallergic; mouse; CD40 receptor associated protein; CRAP; cytoplasmic domain; tumour necrosis factor; TNF; receptor; superfamily; CD30; homology; TNF receptor associated factor; TRAF; modulator; signalling pathway; diagnosis; NF-KappaB; Jun; kinase; atherosclerosis; multiple sclerosis arthritis; systemic lupus erythematosus; graft rejection; allergy; graft versus host disease; autoimmune disease; ds.
                                                                                                                                                                                                                        of the tumour necrosis factor (TNF) receptor superfamily such as CD30 and TNF receptor I, where the protein has no homology to TNF receptor associated factor (TRAF)-proteins. The CD40 binding proteins can be used as modulators of the CD40 signalling pathway, especially to diagnose and treat TRAF-related, CD40-related, NF-kappaB related and/or Jun (kinase)-related diseases, and for the improvement of anti-tumour diseases. Diseases which may be treated include atheroscierosis, graft rejection, graft versus host disease, allergy, and autoimmune disease. The proteins can be used to sensitize tumour cells to anti-tumour treatments and to screen for compounds which interfere with the interaction of the proteins with other protein components of the TRAF CD40 or NF-kappaB related anatheav.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 10;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel proteins used to treat inflammatory diseases, NF-kappaB related diseases and for improvement of anti-tumor treatments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        associated protein (CRAP). CRAP is a functional protein capable of interacting with the cytoplasmic domain of CD40 and/or other receptors

                                                                                                                                                                                                                                                                  expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the provention, diagnosis and treatment of colorectal carcinomas and cancers. Assi7196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the proteins are collectively known as colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAH3254: to AAH37195 and AAG73514 to AAG77788 represent human cancer associated nucleic acid molecules (N) and proteins (P).
                                                                                                                                                                     present invention.

The method is for enhancing apoptosis in cells from a mammal with proliferative disease by treatment with a compound that inhibits compounds are used to treat proliferative diseases, specially cancers of compounds are used to treat proliferative diseases, specially cancers of covary, breast, pancreas, lymph nodes, skin, blood, lung, brain, kidney, criver nasopharnyx, thyroid,central nervous system, prostate, colon, crectum, cervix or endometrium, particularly to increase their sensitivity to chemotherapeutic agents of the IAP or NAIP proceins are detected in many cancers and are associated with poor prognosis, cresistance to chemotherapeutic agents and mutations in p53 (it is suggested that wild-type p53 suppresses transcription of the IAP or NAIP companies.) Transgenic animals are used for testing the effects of antisense collaponucleotides and for screening for the inhibitors.

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI;

N.B. The Sand 3367,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AA265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AA269579 to AA277440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the generic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of

```

The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient; is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for

inhibiting cervical cancer in a patient. useful for gene therapy.

                                                                                                                                                                                                                                           The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;
                                                                                                                                                                                          Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic actids and encoded polypeptides are useful; to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be
                                                                                                                                                      Human

The invention relates to nucleic acid sequences (AAX22211 to AAX22282)
CC encoding human secreted proteins (AAY0133 to AAY01454). The secreted compositing human secreted proteins (AAY0133) to AAY01454). The secreted compositing human sequences are deposited with the ATCC under deposit number atCC 209138, 209139 or 209141. Host cells containing vectors comprising the nucleic acid sequences are used for the recombinant expression of the nucleic acid sequences are useful for preventing, treating or ameliorating medical conditions e.g.
CC by protein or gene therapy. Pathological conditions can be also diaynosed by determining the amount of the new polynucleotides. The nucleic acid conditions to the new polynucleotides of the nucleic acid compared to the sequences, or its fragments, are useful for chromosome identification and amping; as antisonse and triplex-forming therapeutics; in gene therapy; for (forensic) identification of individuals; as molecular compared to the sequences or specific mRNA; in the preparation of oligomers and to raise anti-DNA antibodies. Antibodies are useful as immunoassay reagents (including for in vivo imaging) and conservation of the polynucleotide and complex for disorders may be treated with the polynucleotide and complex for disorders may be treated with the polynucleotide and complex for inflammation, cancer or other forms of cell proliferation, viral composition of embryonic stem cells, to modulate weight, appetite, behaviour etc. and as food additive or preservative. The presents sequence represents a done according a burgan secretary region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          22-JUL-1997

                                                                                                                                                                   A DNA sequence coding for a heterologous polypeptide which can be expressed in and secreted from filamentous fungi is claimed. Pref the DNA sequence codes for bovine preprochymosin, M. meihei preprocarboxyl protease or A. niger preproglucoamylase. Also new are vectors consisting of the DNA sequence plus an operably-linked signal sequence. The vectors may also include a sequence which increases transformation efficiency, e.g. ANS-1.

                                                                                                                                                                                                                                                                                                                               The sequence represents the A. nidulans ANS-1 sequence which is included in the construction of transformation vectors for recombinant protein expression and secretion from a filamentous fungus host. The sequence increases the transformation efficiency of the vector. This illustrates the main claims of the patent, which provide a vector containing (i).DNA encoding a heterologous polypeptide (chymosin, prochymosin, preprochymosin, Aspergillus niger glucoamylase, Humicola grisea glucoamylase or M. miehei carboxyl protease) and (ii) a secretory signal peptide, and a filamentous fungus (Aspergillus, Trichoderma, Neurospora, Podospora, Endothia, Mucor, Cochiobolus or Pyriclaria, especially A. nidulans, A. awamori or T. reesei) transformed with the vector for recombinant protein (enzyme) production.
                                                                                                                                                                                                                          1161

They also serve as tools for the generation of taste topographic maps that elucidate the relationship between the taste topographic maps that elucidate the relationship to taste centres in the brain. The taste modulators are useful for pharmacological and genetic modulation of taste signalling pathways. Modulatory compounds comprising T2R proteins can therefore be used in food and pharmaceutical industries to customise taste, for e.g. to decrease the bitter taste of food or drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAF92502 to AAF92572 represent nucleic acids which encode taste transduction G-protein coupled receptors designated T2R proteins. AAB87731 to AAB87830 to AAB87731 to AAB87830 to Consensus sequences from the present invention. The T2R proteins are taste modulators. The nucleic acids are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (REGC )

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1614 GAGCCTCTTGCATTTTCTT 1596
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polypucleotide of the invention may be used to treat diseases of the peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tang

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. AAX1253B to AAX13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcus infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptidus encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal

N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB7789 represent sequences used in the exemplification of the

Such fragments are used in the method of the invention which describes the isolation of a novel human TANGO-77 encoding nucleic acid and protein. Tango-77 is a member of the cytokine superfamily that is expected to inhibit inflammation by binding to the interleukin-1 receptor (IL-IR). I may also bind to a new receptor so could regulate other cellular processes associated with acute or chronic inflammation, e.g. asthma, chronic myelogenous leukaemia, rheumatoid arthritis, psoriasis and inflammatory bowel disease. It may also induce or suppress interleukins, cytokinus and growth factors. Modulators of this protein are used to treat of prevent conditions associated with abnormal levels of inflammation, or activity of IL-1 or its receptor complex.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The inventors claim mitochondrial NAD(P)+-dependent malate enzyme and DNA encoding it. AAR21845 has 5' and 3' non-coding regions. The enzyme carachyses conversion of malate to pyruvate. Both the DNA and the enzyme are useful for studying carbon metabolism in rapidly dividing cells, esp. pyruvate formation from amino acids.

Polynucleotide sequences AAF17982 - AAF18424 ercode human lung cancer associated proteins represented in AAB58106 - AAB58548. Lung cancer associated proteins and polynucleotide sequences, their agonists, and antagonists may have neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular active general; vulnerary; gastrointestinal general; nephrotropic; antiinfective; gynecological; or antibacterial activity. The invention also includes antibodies specific for the protein or polynucleotide sequences. The lung cancer associated polynucleotide sequences may be used for detection of lung cancer,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; runy consective; immunomodulatory; muscular active; various cardioactive; immunomodulatory; muscular active; gynecological; gastrointestinal; nephrotropic; antlinfective; gynecological; antibacterial; diagnosis; neural disorder; immune disorder; reantibacterial; diagnosis; neural disorder; immune disorder; disor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             basis for the design of oligonucleotides. These were used in PCR for amplification of malate enzyme encoding DNA in a CDNA bank prepd. from fibrosarcoma HS913. Amplified fragments were subcloned in pUC18, sequenced and used to probe the fibrosarcoma bank. A 1923bp insert was isolated and cloned in Bluescript KSr. The poly(A+) tail is not included in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  08-MAR-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1505

                The sequence was obtd. from 3 overlapping clones isolated from a human [24 cell line cDNA library. The DNA can be used to express the Gap b3 protein which is a transformation-dependent cell surface glycoprotein. The protein may be used to produce antibodies and these, or the DNA sequences, can be used to detect and quantify levels of Gap b3 protein or mRNA in biological samples. A high level of the protein is indicative of certain cancers. See also AAu13821-Q13824.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1902
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds are infectious diseases. Polynucleotide sequences AAF18425 - AAF18433 and peptide AAB58549 are used in the course of the invention for the identification and characterisation of the polynucleotide and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chromosome identification, as chromosome markers, and for diagnostic or research purposes. The proteins may be used disorders such as neural, immune, muscular, reproductive,

                                                                         AAA68247 standard;
                                                                                                                                                                                                                                                                                                                              This sequence encodes the human alpha3 integrin protein. The alpha3 integrin sequence is targeted by the anti-integrin alpha3 antibody of the invention. The anti-integrin alpha 3 antibody or its antigen binding fragment are for use as anti-tumour agents, and diagnostic reagent compositions. They can also be used in a chemotherapeutic drug.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Anti-integrin alpha3 antibody and chemotherapeutic drug - anti-tumour agents and diagnostic reagent compositions

Identifying a bacteriophage coding region for treating bacterial infections comprises identifying a nucleic acid encoding a product inhibits bacteria when a bacteriophage infects a bacterium

Example 3; Page 141-151; 456pp; English.

The present invention describes a method for identifying a bacteriophage coding region encoding a product active on an essential bacterial target. The method comprises identifying a nucleic acid sequence encoding a gene product that provides a bacteria inhibiting function when an uncharacterised bacteriophage infects a pathogenic bacterium. The compound active on a target of a bacteriophage inhibitor protein in a bacteria is used to treat or prevent a bacterial infection in an animal. AAA68243 to AAA69442 and AAB16523 to AAB16524 represent bacteriophage nucleotide and protein sequences which are used the present invention. in the exemplification of.

The growth inhibitory gene product of ORF 104 interacts with DnaI derived from S. aureus, to form the basis of a screening assay. DnaI polypeptides and polynucleotides are useful for treating microbial, preferably bacterial, especially staphylococcal, infections, DnaI polypeptides and polynucleotides are useful for biological, ediagnostic, prophylactic, clinical and therapeutic use, and as components in databases useful for search analyses as well as in sequence analysis
                                                                                                                                                                                                            gene
New nucleic acid that is a 5' expressed sequence obtaining cDNAs and genomic DNAs that correspond
                                                                                                   26-FEB-1999;

mRNAS encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAS of DAYA+ RNAS derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dI primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                             New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining CDNAs and genomic DNAs that correspond to 5'ESTs and for
                                                                                                                                                                                             The present sequence is one of a large number of 5' ESTs derived from

                                                                                                                                               The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be
                                                                                                                                                                                                                                                                                                                                      New

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   medicaments for inhibiting the development of breast cancer in a patient. They can also be used to treat breast cancer. Antibodics against these polypeptides can be used to detect and monitor progression of breast cancer in patients. Primers and probes derived from the polypucleotides encoding the breast proteins are useful for detection of breast cancer. Peripheral blood cells from a patient incubated in the presence of at least one polypeptide, such that T cells proliferate, are useful in manufacture of a medicament for treating breast cancer in a patient. Antigen presenting cells incubated in the presence of at least one polypeptide are also useful for treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence encodes a human breast tumour protein immunogenic fragment of the invention. The polypeptides or nucleic acids encoding them are useful in vaccines and pharmaceutical compositions for manufacture of medicaments for inhibiting the development of breast cancer in a patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1001 BP; 278 A; 159 C; 160 G; 404 T; 0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                5
                                                 The present sequence was isolated from a breast tumour cDNA library. It is provided in a specification relating to compounds for immunotherapy and diagnosis of breast cancer. Breast tumour antigens and the polynucleotides that encode them may be used in the production of a pharmaceutical composition to be used in the treatment of breast cancer proliferated I cells and incubated antigen presenting cells are also required. The polypeptides and polynucleotides may also be used to produce a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI;
